Chapter 1

Introduction

Why High Performance Computing?

Freie Universität Berlin

Quote:

It is hard to understand an ocean because it is too big.

It is hard to understand a molecule because it is too small.

It is hard to understand nuclear physics because it is too fast.

It is hard to understand the greenhouse effect because it is too slow.

Supercomputers break these barriers to understanding.

They, in effect, shrink oceans, zoom in on molecules, slow down physics, and fastforward climates. Clearly a scientist who can see natural phenomena at the right size and the right speed learns more than one who is faced with a blur.

Al Gore, 1990

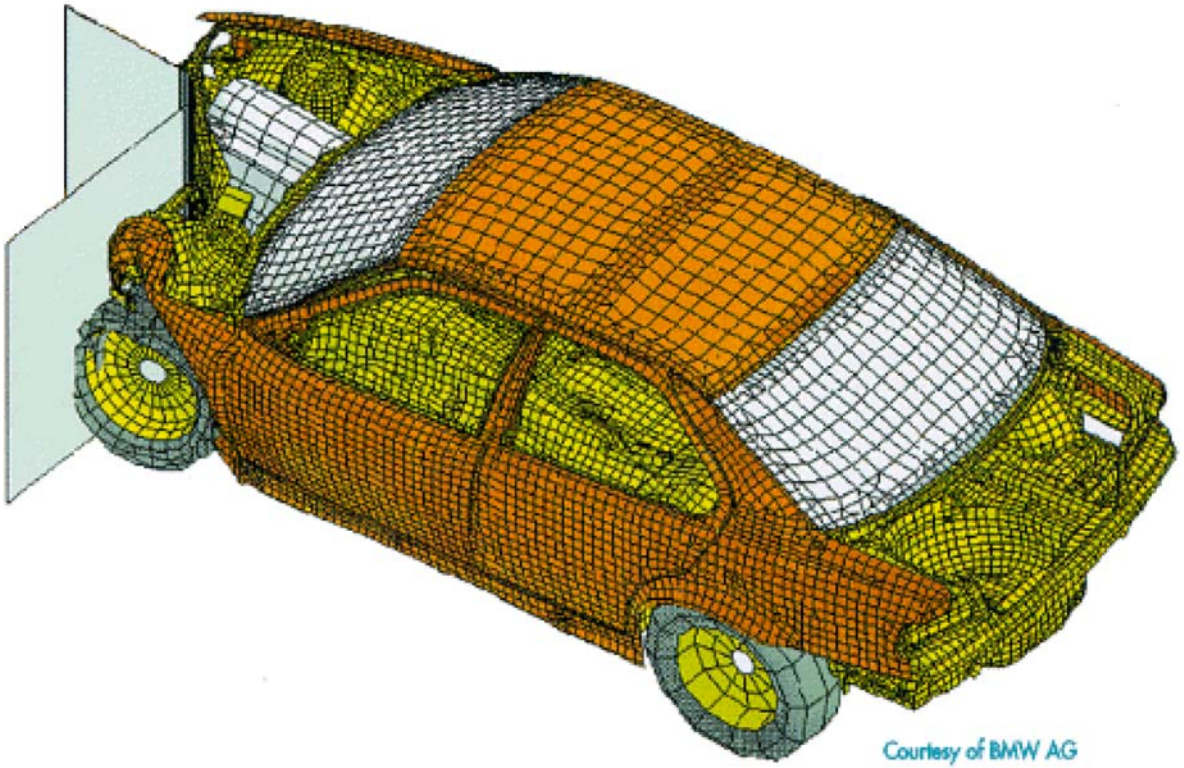
Why High Performance Computing?

Freie Universität Berlin

- Grand Challenges (Basic Research)
  - Decoding of human genome
  - Kosmogenesis
  - Global Climate Changes
  - Biological Macro molecules
- Product development
  - Fluid mechanics
  - Crash tests
  - Material minimization
  - Drug design
  - Chip design
- IT Infrastructure
  - Search engines
  - Data Mining
- Virtual Reality
  - Rendering
  - Vision

Examples for HPC-Applications: Finite Element Method: Crash-Analysis

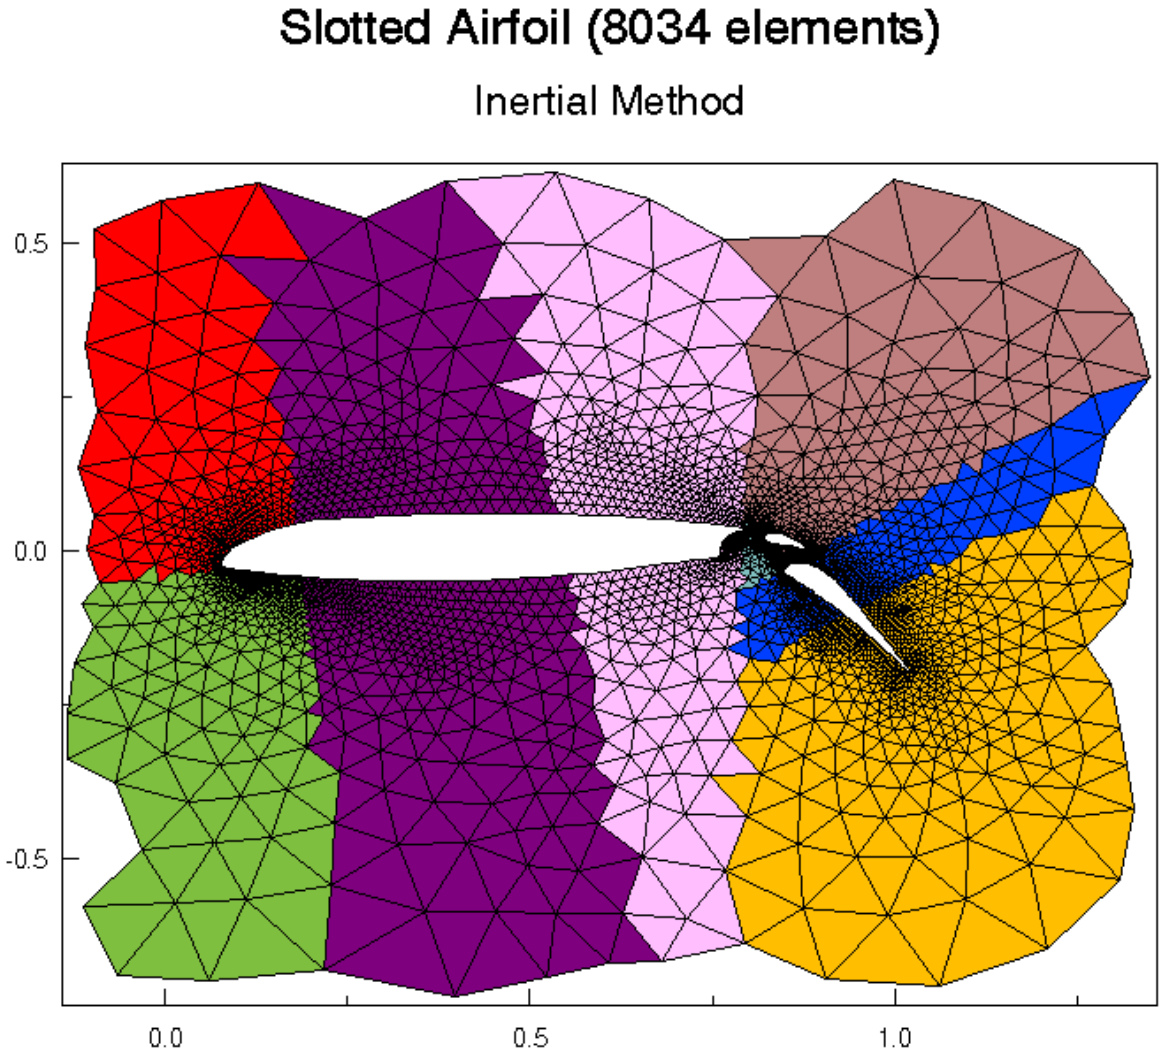
Freie Universität Berlin



Asymmetric frontal impact of a car to a rigid obstacle

Examples for HPC-Applications: Aerodynamics

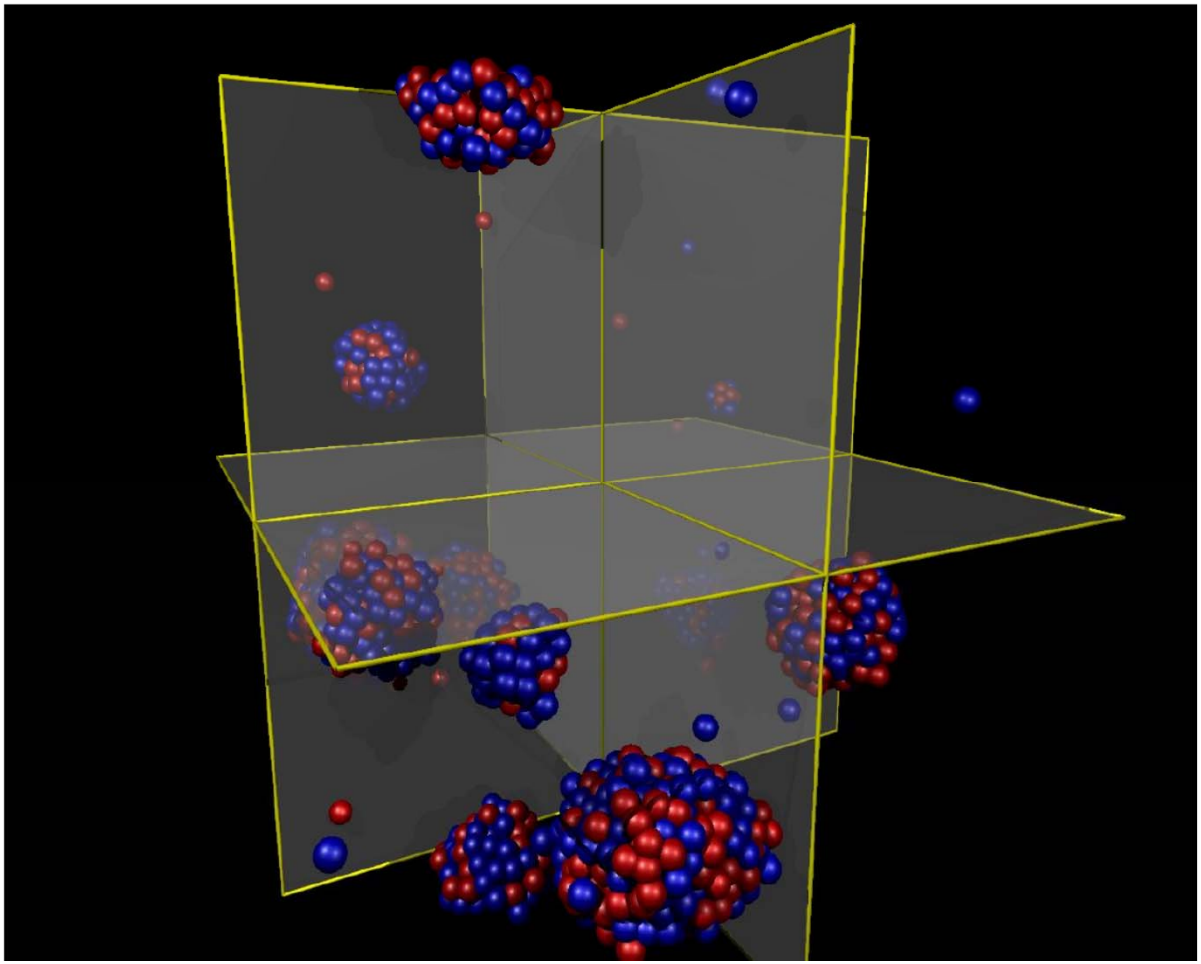
Freie Universität Berlin



Examples for HPC-Applications: Molecular dynamics

Freie Universität Berlin

Simulation of a noble gas (Argon) with a partitioning for 8 processors: 2048 molecules in a cube of16 nm edge length simulated in time steps of 2×10^{-14} sec.



Examples for HPC-Applications: Nuclear Energy

Freie Universität Berlin

- 1946 Baker Test
- 23.000 Tons TNT

- Lots of nukes produced during the cold war
- Status today: Largely unknown

Source: Wikipedia

Examples for HPC-Applications: Visualization

Freie Universität Berlin

Rendering (Interior architecture)

Rendering (Movie: Titanic)

Photo realistic presentation using sophisticated illumination modules

Examples for HPC-Applications: Analysis of complex materials

Freie Universität Berlin

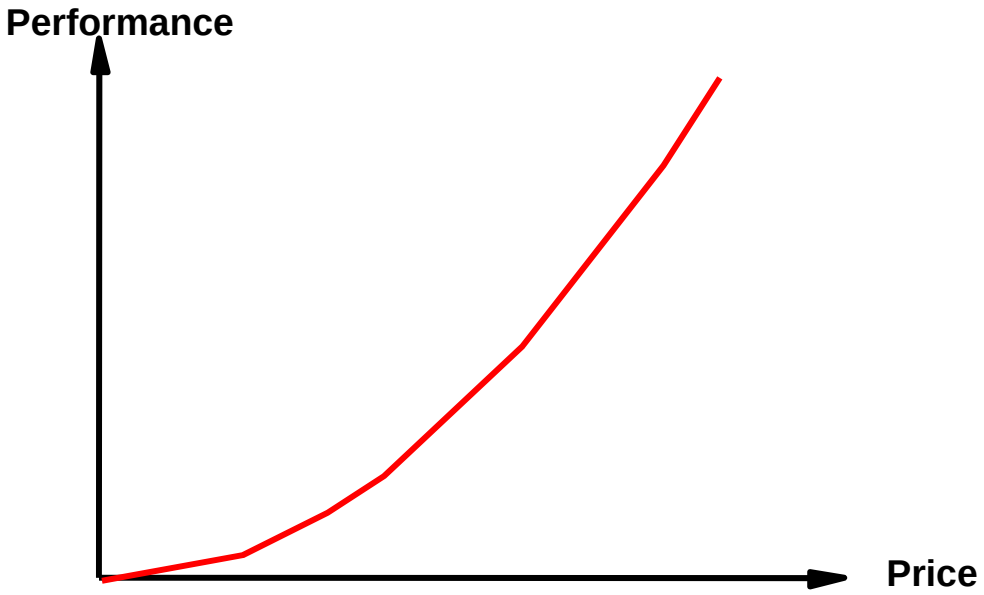
Grosch's Law



„The performance of a computer increases (roughly) quadratically with the prize"

Consequence:

It is better to buy a computer which is twice as fast than to buy two slower computers.

(The law was valid in the sixties and seventies over a wide range of universal computers.)

Eighties

Freie Universität Berlin

Availability of powerful Microprocessors

- High Integration density (VLSI)
- Single-Chip-Processors
- Automated production process
- Automated development process
- High volume production

Consequence:

Grosch's Law no longer valid:

1000 cheap microprocessors render (theoretically) more performance in (MFLOPS) than expensive Supercomputer (e.g. Cray)

Idea:

To achieve high performance at low cost use many microprocessors together

➔Parallel Processing

Eighties

Freie Universität Berlin

- Wide spread use of workstations and PCs

  Terminals being replaced by PCs

  Workstations achieve (computational) performance of mainframes at a fraction of the price.

- Availability of local area networks (LAN) (Ethernet)

  Possibility to connect a larger number of autonomous computers using a low cost medium. Access to data of other computers. Usage of programs and other resources of remote computers.

- Network of Workstations as Parallel Computer

  Possibility to exploit unused computational capacity of other computers for computational-intensive calculations (idle time computing).

Nineties

- Parallel computers are built of a large number of microprocessors (Massively Parallel Processors, MPP), e. g. Transputer systems, Connection Machine CM-5, Intel Paragon, Cray T3E
- Alternative Architectures are built (Connection Machine CM-2, MasPar).
- Trend to use cost efficient standard components (“commercial-off-the-shelf, COTS”) leads to coupling of standard PCs to a “Cluster” (Beowulf, 1995)
- Exploitation of unused compute power for HPC (“idle time computing”)
- Program libraries like Parallel Virtual Machine(PVM) and the Message Passing Interface (MPI) allow for development of portable parallel programs
- Linux as operating system for HPC becomes prevailing

10	SuperMUC	iDataPlex DX360M4, Xeon E5-2680 8C 2.70GHz, Infiniband FDR	Leibniz Rechenzentrum	Germany	147456	2897000	3185050

Tianhe-2 (MilkyWay-2), National Super Computer Center in Guangzhou, Rank 1

Freie Universität Berlin

- Intel Xeon systems with Xeon Phi accelerators
  - 32000 Xeon E5-2692 (12 Core, 2.2 Ghz)
  - 48000 Xeon Phi 31S1P (57 Cores, 1.1 GHz)
  - Organization: 16000 Nodes, each
    - 2 Xeon E5-2692
    - 3 Xeon Phi 31S1P
- 1408 TB Memory
  - 1024 TB CPUs (64 GB per node)
  - 384 TB Xeon Phi (3x8 GB per node)
- Power 17.6 MW (24 MW with cooling)

Titan (Oak Ridge National Laboratory), Rank 2 (2012: R1)

Cray XK7

- 18,688 nodes with 299,008 cores, 710 TB (598 TB CPU and 112 TB GPU)
  - AMD Opteron 6274 16-core CPU
  - Nvidia Tesla K20X GPU
  - Memory: 32GB (CPU) + 6 GB (GPU)
- Cray Linux Environment
- Power 8.2 MW

JUQUEEN (Forschungszentrum Jülich), Rank 8 (2012: Rank 5)

- 28 racks (7 rows à 4 racks)
- 28,672 nodes (458,752 cores)
- Rack: 2 midplanes à 16 nodeboards (16,384 cores)
- Nodeboard: 32 compute nodes
- Node: 16 cores
  IBM PowerPC A2, 1.6 GHz

- Main memory: 448 TB (16 GB per node)
- Network: 5D Torus — 40 GBps; 2.5 µsec latency (worst case)
- Overall peak performance: 5.9 Petaflops
- Linpack: > 4.141 Petaflops

HERMIT (HLRS Stuttgart), Rank 39 (2012: Rank 27)

Freie Universität Berlin

- Cray XE6

- 3.552 Nodes
- 113.664 Cores
- 126TB RAM

Top 500 Nov 2014

Freie Universität Berlin

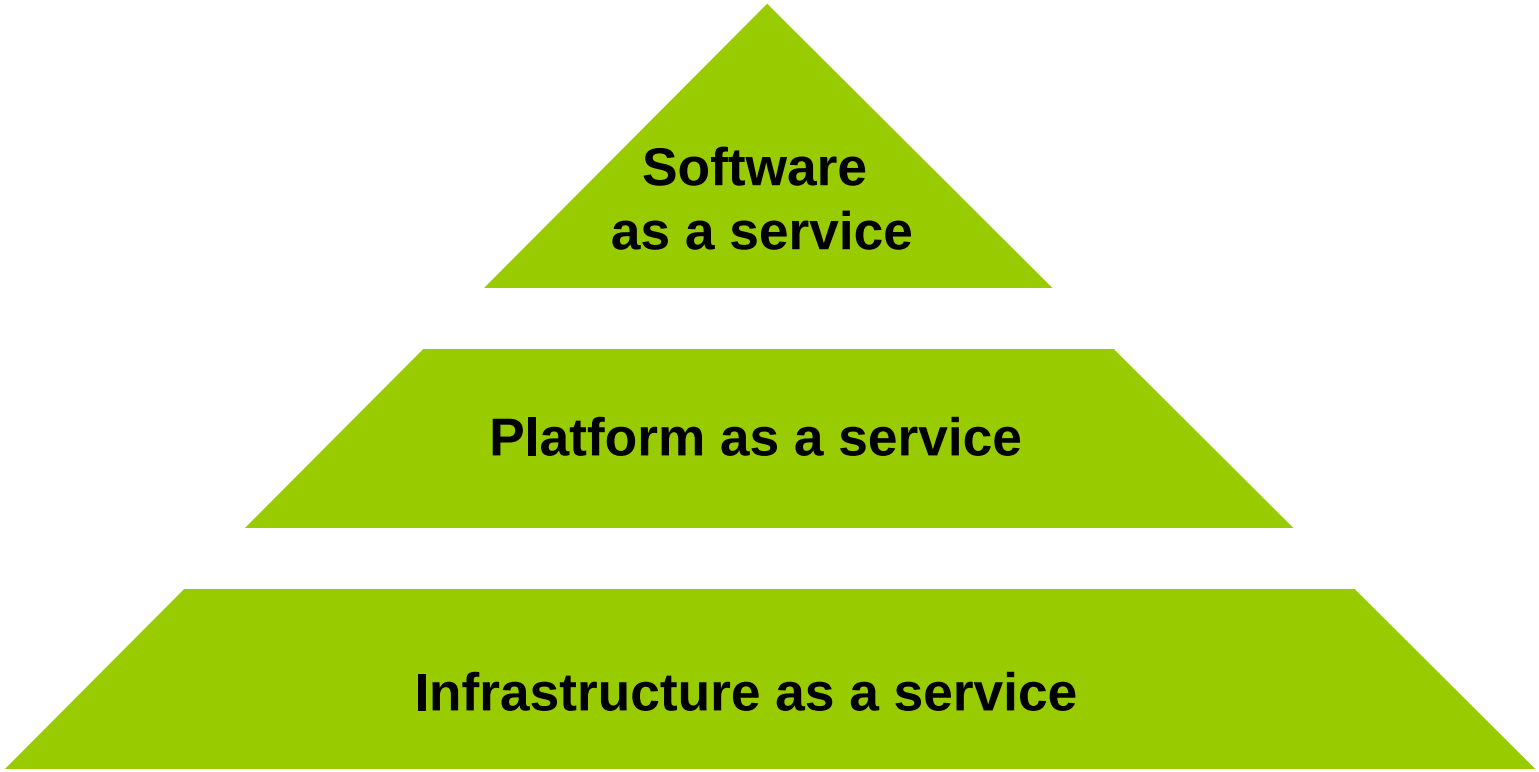
- Usage of remote physical and logical resources

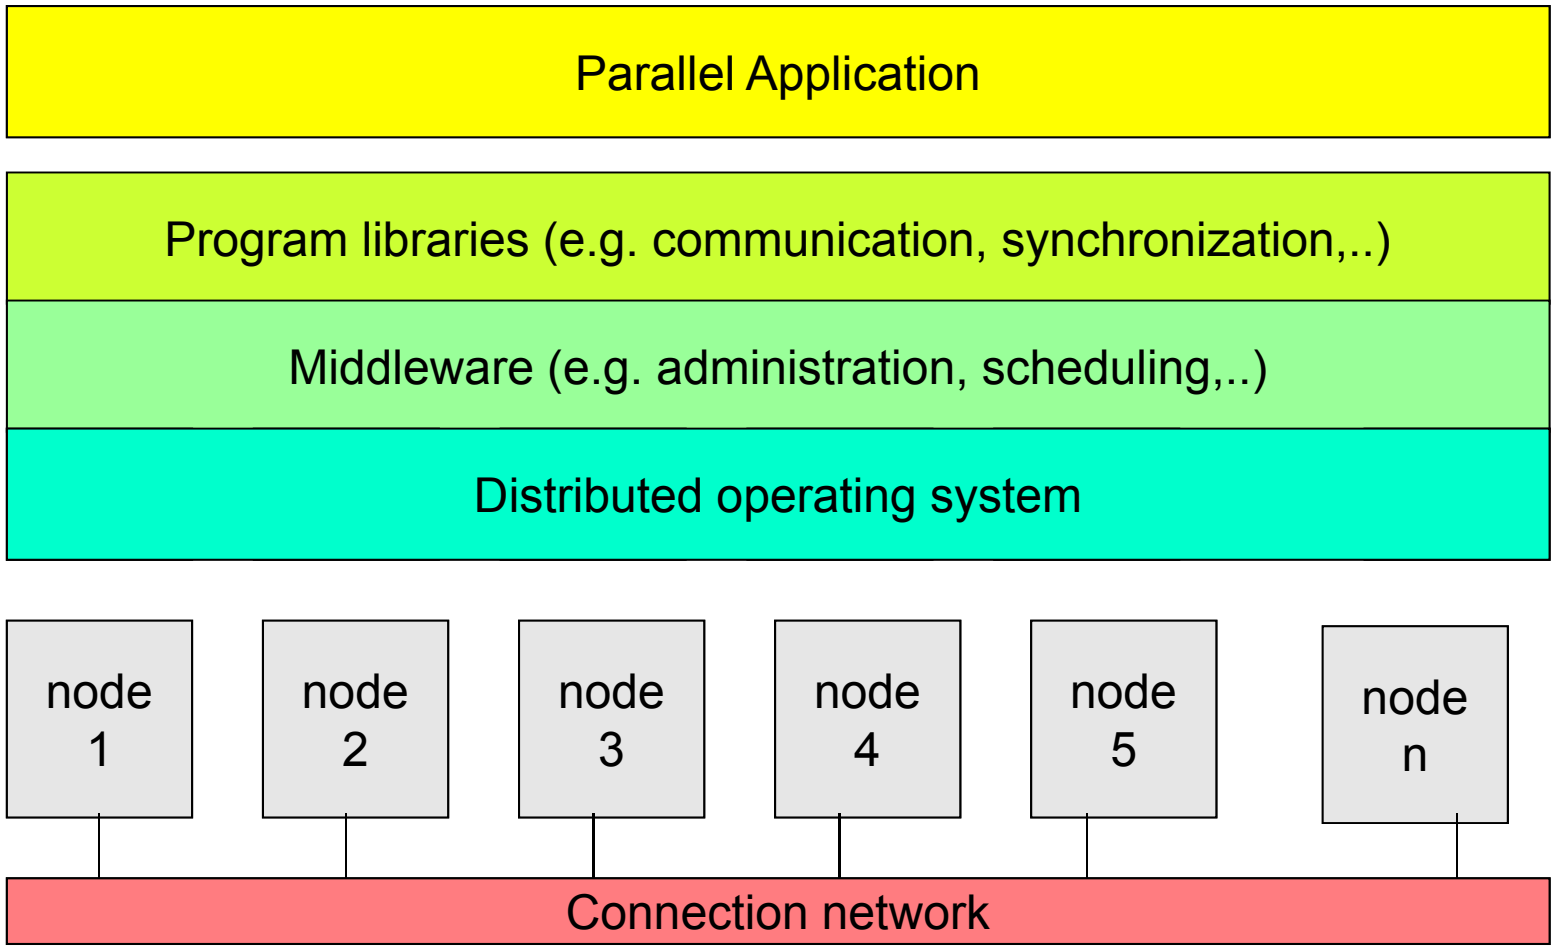


Supercomputer in the Cloud: Rank 64

Freie Universität Berlin

- Amazon EC2 C3 Instance
- Intel Xeon E5-2680v2 10C 2.800GHz
- 10G Ethernet
- 26496 Cores (according to TOP500 list)
- Rmax: 484179 GFLOPS
- Rpeak: 593510,4 GFLOPS

Support for parallel programs



Tasks

Freie Universität Berlin

User's point of view (programming comfort, short response times)

- Efficient Interaction (Information exchange)
  - Message passing
  - Shared memory
- Synchronization
- Automatic distribution and allocation of code and data
- Load balancing
- Debugging support
- Security
- Machine independence

Operator's point of view (High utilization, high throughput)

- Multiprogramming / Partitioning
  - Time sharing
  - Space sharing
- Load distribution / Load balancing
- Stability
- Security
