Please prepare your solutions / answers in written form. Make sure to always prepare them in a way that you are able to present them to your classmates and discuss your solution process effectively.

Please remember to always list your reference sources.

Learning aims:
- Develop measures and understand and discuss measurement in the software development process with the help of the goal question metric approach (GQM).
- Gain experience with measuring and measures in the software development process by using the goal question metric approach in an OSS project.

Preliminary remark and time schedule: In the next three tutorials you will carry out your own study with the goal question metric approach, working in pairs. Proceed in the following way:

<table>
<thead>
<tr>
<th>Time span</th>
<th>Tasks</th>
<th>Content of the tutorial</th>
</tr>
</thead>
</table>
| by 2012-12-10 | Read the source of GQM.  
Tasks 7-1, 7-2                                                                 | Present GQM.                                      |
| by 2012-12-17 | Choose OSS projects.  
Formulate/Establish possible goals (goals according to GQM). Task 7-3, 7-4 | Preliminary results: Discussion of possible goals and difficulties with the goal formulation. |
| by 2013-01-07 | Continue and finish study.  
Task 7-5                                                                 | PechaKucha: Final presentation.                   |

Task 7 – 1: autonomous research (due on 2012-12-10)

Read up on the answers to the following questions. The article mentioned in the lecture by Victor Basili and David Weiss on the goal question metric approach (GQM) may be useful: *A Methodology for Collecting Valid Software Engineering*. You can find the article on the lecture’s website.

1. Why is it reasonable to proceed top-down and not bottom-up when using the goal question metric approach?
2. Why is measuring important in the software engineering process?
3. Which information sources may help to develop the goals' elements?
4. Which pitfalls remain for the data analysis despite the goal question metric approach?

Task 7 – 2: GQM Paper (due on 2012-12-10)

Please do some research and read up on a paper of your choice that deals in some form with GQM and be prepared to talk about it in the tutorial.

- Search options at the FU digital library (free access through the FU net):

Consider the following:

- Core issue / content of the paper
- Results and core statement of the paper
- Contents you found particularly interest or surprising
Practice sheet 7 – due on 2012-12-10, 2012-12-17, and 2013-01-07

- Formulated goal with the elements object of measurement, goal, quality focus, perspective, context
- What is said concerning the activities during the six GQM steps?
- Issue and objective of the research project: What is being examined? Which unsolved questions are to be answered through the data assessment and analysis?
- What and whom does the research project serve? → applies to the practical or social applicability of the results.
- What has been the motivation for the research project?
- What kind of data was gathered and how?
- What kind of research strategy did the researchers follow?
- ...

Task 7 – 3: preparation of the study (due on 2012-12-17)
Work on your study in pairs. Divide the task where appropriate! Pay attention to the remarks on the last page!

1. Choose an open source project on which you would like to concentrate for your study.
2. Formulate/Establish possible goals for your study. Describe how to reach these goals and what you have already done in this respect!
3. Note down your central insights, questions and problems. We’ll talk about them in the tutorial!
4. Create a page in the Softwareprozesse Wiki in the Blackboard system where you present your project and put on your results from this task.

Task 7 – 4: first steps according to GQM (due on 2012-12-17)
You should be prepared to give a preliminary report in the tutorial concerning your progress:

1. Concentrate on two of your possible goals from task 7-3
2. Formulate your goals with the elements: Object of measurement, goal, quality focus, perspective, context.
3. Name the questions formulated so far and the corresponding metrics.
4. Which tools do you plan to use?
5. Note down your central insights, questions and problems. We’ll talk about them in the tutorial!
6. Put your results of this task on your page in the Softwareprozesse Wiki.
Task 7 – 5: PechaKucha: final presentation (due on 2013-01-07)

Prepare a PechaKucha presentation touching upon the following points:

1. Short introduction of the project you deal with.
2. Which goal did you chose and how did you find it?
3. How did you develop your questions? Were there any changes? Why?
4. Which metrics did you develop for your questions?
5. Which tools did you (not) use to study your metrics? How do you evaluate these?
6. Which answers concerning your GQM questions were you able to find? Present your data respectively in an appropriate form (possibly with graphics).
7. Which statements are you able to make concerning your goals?
   a. In which way do the answers to your questions contribute to the goal? Which assumptions did you make and should one believe you?
   b. Which constraints apply? Why?
8. Attach this presentation to your page in the Softwareprozesse Wiki.

PechaKucha („wirres geplapper“, „chit-chat“) is a presentation method.

Based on the knowledge that one’s attention span diminishes after the first seven minutes, PechaKucha presentations are constructed following strict rules:

• Lectures are presented with no more and no less than 20 slides or pictures.
• The lecturer takes precisely 20 seconds for each slide,
• which means that the overall presentation time is 6 minutes and 40 seconds.
• The slides should change automatically. It is suggested to set your equipment accordingly, or ask a class mate to assist with switching to the next slide every 20 seconds.

Remarks:

Study the program code, VCS\(^1\) entries or the mailing lists (and/or whatever else you might need) of an OSS project\(^2\) with the help of certain metrics. The metrics are, however, not determined by the task, but should be determined by you with the goal question metric approach. Pay attention to the following:

- First you need one or several goals, i.e. you need to think about which improvement goals you would like to reach with respect to the software/project (possibly based on business or project goals). This is no easy task. Try to find out whether there are certain points that pose special problems to the project or are considered as future challenges. Most likely you need to deal with the project maintainers or the mailing list.\(^3\)

- Normally, one should be completely free in establishing these goals. However, as we do not want to burden ourselves with possibly creating the data base for this task on our own, please have in mind that mostly only the program code and VCS entries are available when establishing your goals. (You may also use the bug data base, feature requests or mailing list, if you like. This means however that it will be more difficult to make the data "processable"!) Despite the perspective in this task, do not forget that at this stage this is not necessarily a standard procedure according to GQM.

- Follow the path determined by GQM to gain appropriate metrics.

- Now you need tools to evaluate your metrics. You may find a list of tools for static code analysis at
  
  
  - [http://java-source.net/open-source/code-coverage](http://java-source.net/open-source/code-coverage)

  You can use StatCVS, StatSVN or CVSAnalY (also for Subversion) to evaluate the version control systems. **Additionally look for tools suited for your needs and test them.**

  You may also write your own analysis tools. With the programming language R ([http://www.r-project.org/](http://www.r-project.org/)), which was developed for (static) data analysis and graphics, you can easily perform analyses that resemble those in the article *Two Case Studies of Open Source Software Development: Apache and Mozilla* (see last practice sheet).

- On the basis of the established "values" you now need to answer your GQM questions and make statements concerning your goals!

---

\(^1\) VCS – Version Control System, e.g. CVS and Subversion.

\(^2\) This should be big enough (see last practice sheet) and provide adequate data!

\(^3\) Dare to enquire in detail (concerning goals and problems (in the product but also in the process)). Only then you get information matching the chosen project and may establish adequate metrics.
